# NUKE<sup>EM</sup>

## Like a Pro Grower

### Follow These Simple Rules for Success

- Use Flying Skull's Spread Coat wetting agent when mixing up Nuke Em. This will greatly enhance Nuke em's ability to completely coat the pest and reduce the amount of Nuke Em needed. The use of Spread Coat is not recommended when applying Nuke Em to dried plant material.
- Don't mix Nuke Em with other pesticides. This rule applies to ALL brands of pesticides.
- Water the plants thoroughly with good runoff and allow enough time for the plant to fully hydrate before spraying Nuke Em. This will help to hydrate the plant and detoxify the soil allowing the plant to have a better chance to fight off insects, molds and mildew.
- No need to turn down LED or fluorescent lighting systems but turn heat producing HID lighting systems that are closer than 8 feet above the plants to a lower light level before spraying Nuke Em.
- Follow Label Directions.

Ya got bugs?

Ya want 'em dead?

Do it right the first time!
